AI DERIVATIVES:

THE APPLICATION TO THE DERIVATIVE WORK RIGHT TO LITERARY
AND ARTISTIC PRODUCTIONS OF AI MACHINES

Daniel J. Gervais, PhD*

ABSTRACT

This Article predicts that there will be attempts to use courts to try to broaden the derivative work right in litigation either to prevent the use of, or claim protection for, literary and artistic productions made by Artificial Intelligence (AI) machines. The Article considers the normative valence of, and the (significant) doctrinal pitfalls associated with, such attempts. It also considers a possible legislative alternative, namely attempts to introduce a new sui generis right in AI productions. Finally, the Article explains how, whether such attempts succeed or not, the debate on rights (if any) in productions made by AI machines is distinct from the debate on text and data mining exceptions.
AI DERIVATIVES

I. INTRODUCTION

Artificial Intelligence (AI) machines are increasingly used to assist authors in creating copyrightable works, but they are also at the point where they can “create” literary and artistic productions autonomously, in the sense that the “cause” of the work is not human. To do so, AI machines use machine-learning algorithms and process data corpora often consisting of existing copyrighted works.

Enter the derivative work right contained in 17 U.S.C. §106(2) (hereinafter “The Copyright Act”). The Copyright Act provides an exclusive right “to prepare derivative works based upon the copyrighted work” and defines “derivative work” in part as any work “based upon one or more preexisting works.” This definition of the right could loosely be used as a definition of machine-learning when applied to the creation of literary and artistic productions because AI machines can produce literary and artistic content (output) that is almost necessarily “based upon” a dataset consisting of preexisting works. For example, an AI machine can be “fed” existing works

1 I discuss elsewhere how “cause” (a version of proximate, not simple, cause) is an appropriate notion to determine whether a literary or artistic work has a human author. See generally Daniel Gervais, The Machine as Author, 105 IOWA L. REV. 2053 (2020); and Daniel Gervais, The Human Cause, INTELLECTUAL PROPERTY AND ARTIFICIAL INTELLIGENCE (R. Abbott, ed., forthcoming 2022). I give multiple examples of those types of productions in both sources. This Article uses “machine” as a generic term that may apply to a computer using AI software but could also cover machines capable of movement such as a robot painting on canvas.

2 Machine learning is the dominant form of AI. See Roberto Iriondo, Machine Learning (ML) vs. Artificial Intelligence (AI), Towards AI, (Oct. 15, 2018), https://medium.com/datadriveninvestor/differences-between-ai-and-machine-learning-and-why-it-matters-1255b182fc6 (“‘Machine learning [ML] is the study of computer algorithms that allow computer programs to automatically improve through experience.’—ML is one of the ways we expect to achieve AI. Machine learning relies on working with large datasets by examining and comparing the data to find common patterns and explore nuances[,]” quoting Prof. Tom M. Mitchell, former Chair of the Machine Learning Department at Carnegie Mellon University).

5 A well-known example is the machine named e-David, which produces paintings using a complex visual optimization algorithm that “takes pictures with its camera and draws original paintings from these photographs.” Shlomit Yanisky-Ravid, Generating Rembrandt: Artificial Intelligence, Copyright, and Accountability in the 3A Era—The Human-Like Authors Are Already Here—A New Model, 2017 MICH. ST. L. REV. 659, 662 (2017). See also Part III. A infra.
composed by J.S. Bach and produce a new musical composition “in the style of Bach.”
Or it can scan works by Rembrandt and produce a new painting in the style of the Dutch master.
One can readily see how a broad interpretation of the derivative work right resulting from a wide-ranging reading of the statutory definition could provide a very far-reaching tool to copyright owners.

A quick terminological point should be made before proceeding further. The Article uses the term “production” to refer to the perceptible output of an AI machine. If this input belongs in the literary and artistic category, then it is a literary and artistic production. This terminological distinction is necessary because for that production to be a “work” (of authorship) protected by the Copyright Act, two conditions must be met. First, that production must be original and, second, it must be fixed. Originality is not defined in the statute but the Supreme Court defined it as meaning that the work must be independently created by its author and must embody expression that is at least minimally creative. The test is satisfied when the work is the result of creative choices made by the author. I have argued elsewhere that originality implies that the work must be the result of human creative choices.

7 See Yanisky-Ravid, supra note 5, at 663.
8 17 U.S.C. §101 refers to objects protected by the Copyright Act as “original works of authorship.” In adopting “production” as its terminological stance, the Article borrows from language used in Article 2 of the most important international copyright treaty, the Berne Convention for the Protection of Literary and Artistic Works of, Sept. 9, 1886, as revised at Paris, July 24, 1971, 1161 U.N.T.S. 30 [hereinafter Berne Convention]. The Berne Convention had 180 member States as of January 2022. The United States became a party to the Convention on Mar. 1, 1989. See Contracting Parties: Berne Convention, WORLD INTELLECTUAL PROPERTY ORGANIZATION, https://www.wipo.int/treaties/en/ShowResults.jsp?lang=en&treaty_id=15 (last visited Dec. 12, 2021). The term “output” can also be used generically and would include literary and artistic productions made by a machine.
11 See id. §7(b).
AI DERIVATIVES

treat this question as unsettled in the caselaw, though it is worth noting that the United States Copyright Office has taken the same position defended by the Author, as have a number of senior scholars.¹³

The Article proceeds as follows. In Part II, it briefly explains how AI technology works and how AI machines produce literary and artistic outputs. In Part III, it recalls the ins and outs of the derivative work right and then its potential new role in the AI context. In Part IV, to situate and properly cabin its prescriptive findings, it considers possible new legislation to introduce a sui generis right in AI productions and assesses the impact of rights in AI productions, if any, on the ongoing discussions about text and data mining exceptions.

II. THE AI “CREATION” PROCESS & ITS COPYRIGHT RAMIFICATIONS

The purpose of this Part is to offer a brief glimpse into AI technology only to the extent necessary to discuss the derivative work right in detail in the next Part. At the most basic level, AI is, first and foremost, computer code running on one or more computers, often but not necessarily connected to the Internet, that can learn from a dataset—sometimes a huge dataset—hence the label “Big Data.”¹⁴ This process is known as machine-learning, which today is “the

¹³ See U.S COPYRIGHT OFFICE, COMPENDIUM OF U.S. COPYRIGHT OFFICE PRACTICES§ 306 (3ded., 2017); Pamela Samuelson, Allocating Ownership Rights in Computer-Generated Works, 47 Pitt. L. Rev. 1186, 1208 (noting that protecting machine productions by copyright would “over-reward[ ] the programmer, particularly in light of the fact that the programmer is no more able to anticipate the output than anyone else”); Jane C. Ginsburg, The Concept of Authorship in Comparative Copyright Law, 52 DePaul L. Rev 1063, 1066 (2003) (arguing that an author is the “human being who exercises subjective judgment in composing the work and who controls its execution”) (emphasis added); Sam Ricketson, People or Machines: The Berne Convention and the Changing Concept of Authorship, 16 Colum. J. L. & Arts 1, 8 (1991) (noting that at the outset of the Berne Convention, “[d]espite the omission of a definition of ‘author,’ . . . there was nonetheless a basic agreement between the contracting states as to the meaning of the term, and, because of this, it was thought unnecessary to define it”). See also generally Jane C. Ginsburg and Luke Ali Budiardjo, Authors and Machines 34 BERK. TECH. L. J. 343 (2019). Naturally, the Internet as “global meme factory” probably makes it easier than ever to produce derivative content. See Daniel Gervais, Authors, Online, 38 Colum. J. L. & Arts 385, 385 (2014).

¹⁴ Big Data can be defined according to “three essential features, a fourth that, though not essential, is increasingly typical, and a fifth that is derived from the other three (or four). Those features are volume, veracity, velocity, variety, and value.” Daniel Gervais, TRIPS Meets Big Data, in BIG DATA AND GLOBAL TRADE LAW 160–61 (Mira Burri, ed. 2021).
dominant AI technology.”¹⁵ Machine-learning can be supervised (by humans), or not. “Unsupervised” in this context means that the system is “trained on a dataset without explicit instructions or labelled data.”¹⁶ Situated between supervised and unsupervised learning, reinforcement learning is a third mode of machine-learning, in which humans verify what the machine has learned on its own and hopefully correct mistakes, often using sampling techniques.¹⁷

Machine-learning in all three modes is used both “to discern and operationalise patterns in data.”¹⁸ It uses a set of “computational methods using experience to improve [its] performance or to make accurate predictions.”¹⁹ Using machine-learning, an AI system can “automatically generate heuristics” and make autonomous determinations of various kinds.²⁰ It can adjust its “behavior to enhance [its] performance on some task through experience.”²¹ A machine can, for example, be shown pictures of cats and dogs and then learn the features of each so that it can recognize cats and dogs it has never “seen” before.²² The quality of the learning process is

²¹ WOLFGANG ERTEL., INTRODUCTION TO ARTIFICIAL INTELLIGENCE 102 (Ian Mackie ed., Nathaniel Black trans., Springer-Verlag London Ltd. 1st ed. 2011). AI programmers use several different algorithmic techniques, depending (usually) on the task at hand. For a detailed overview, see EXPLAINING DECISIONS MADE WITH AI, supra note 15, at 115–19.  
obviously dependent on the quality of the training data, as some well-documented disastrous examples have brought to light.\textsuperscript{23} The machine-learning function can take the form of “deep learning,” a subset of machine-learning using a layered structure of algorithms allowing the machine to learn and make predictions and decisions on its own.\textsuperscript{24} Deep learning has been called “the true challenge to artificial intelligence,” namely “solving the tasks that are easy for people to perform but hard for people to describe formally—problems that we solve intuitively, that feel automatic, like recognizing spoken words or faces in images.”\textsuperscript{25} With deep learning, one could say—acknowledging that metaphors are intellectual shortcuts—that the computer has its own, autonomous brain.\textsuperscript{26} Importantly, deep learning is \textit{automated} and often (if not almost always) removed from direct human input or control.\textsuperscript{27}

There are various ways to make AI systems learn and produce better. One of them is the development of General Adversarial Networks (GANs), a technological path likely to grow the affordances of AI systems both qualitatively and quantitatively.\textsuperscript{28} GANs’ potential is huge,
because they can learn to mimic any distribution of data. That is, “GANs can be taught to create worlds eerily similar to our own in any domain: images, music, speech, prose,” sometimes using smaller datasets.\textsuperscript{29} GANs have been used to create literary and artistic content. Indeed, a painting produced by a GAN was sold at auction in 2018 for $432,500.\textsuperscript{30}

What the technology described above boils down to is that a large amount of the inputs needed for an AI machine to produce \textit{contemporary} literary and artistic content is inevitably preexisting copyrighted works that are still protected, unlike the Bach and Rembrandt examples mentioned above for which the term of protection, assuming it even existed in some form at the time, has long expired.\textsuperscript{31} In deep learning scenarios, a large dataset is typically used. In the case of GANs, a smaller set of preexisting works may well be sufficient.\textsuperscript{32}

\section*{III. A NEW ROLE FOR THE DERIVATIVE WORK RIGHT?}

\textbf{A) Overview of the Derivative Work Right}

If there is one definition in the United States Copyright Act that raises eyebrows and uses language that cannot \textit{literally} mean what it says, it is the definition of “derivative work.” That definition in relevant part reads as follows: “a work \textit{based upon one or more preexisting works}, such as a translation, musical arrangement, dramatization, fictionalization, motion picture picture version,
sound recording, art reproduction, abridgment, condensation, or any other form in which a work may be recast, transformed, or adapted.”

What this Article means when it says that the definition cannot literally mean what it says is simply that human creations are often, if not almost always, based upon some other work that the author has read, seen, consulted, experienced or been influenced by in some other way. There is a what one might call a general osmosis of creativity through both space and time that the famous saying often attributed to Isaac Newton that we “stand on the shoulder of giants” captures in part.

Given the “or in any other form” language in the definition of “derivative work,” which signals that the definition is not exhaustive, an attempt to read the broad language of the first part of the statutory definition (the “based upon” clause) can be restrained by the enumeration that follows in application of the ejusdem generis rule. One can argue that the list captures the major forms of derivation that come under the derivative work umbrella and that the opening clause may then just capture what I have elsewhere labelled “penumbral derivatives.” Other arguments to limit the reach of the right exist. Professor Paul Goldstein for example, has argued that, in light of the enumeration, the statutory text is intended primarily to protect certain licensing markets,

---

34 For example, it is well-known that to learn creative writing or art humans learn from existing masterpieces and other works. See Daniel Gervais, The Derivative Right, or Why Copyright Protects Foxes Better than Hedgehogs, 15 VAND. J. ENT. & TECH. L. 785, 851 (2013) [hereinafter Gervais, Foxes] (“By copying a master’s work, the ‘pupil’ might at least get a glimpse of the great author’s mind, which would seem like a normatively desirable process. ‘L’art naît d’un regard sur l’art,’ as the French would say: art is born from a view on existing art.”).
35 See generally ROBERT K. MERTON, ON THE SHOULDERS OF GIANTS 8–12 (1993). Professor Bridy, for example, has argued along those lines “all cultural production is inherently derivative.” Annemarie Bridy, Coding Creativity: Copyright and the Artificially Intelligent Author, 2012 STAN. TECH. L. REV. 5, 12 (2012).
36 On the ejusdem generis rule, see Garcia v. United States, 469 U.S. 70, 74 (1984): When general terms follow an enumeration of persons or things, such general words are not to be construed in their widest extent, but are to be held as applying only to persons or things of the same general kind or class as those specifically mentioned. In 17 U.S.C. § 101 of course, the general words of the “based upon” clause precede instead of follow, but the canon could still be invoked. The canon, however, “cannot be used to ‘obscure and defeat the intent and purpose of Congress’ or ‘render general words meaningless.’” United States v. Kaluza, 780 F.3d 647, 661(5th Cir. 2015).
37 See Gervais, Foxes, supra note 34, at 808.
though he acknowledges that even when following that approach sometimes courts have incorrectly overextended the right’s scope.\(^{38}\)

The risk of an overextension by interpretation is real.\(^{39}\) As the Article adumbrated in the Introduction and explains further in the next Part, with AI the debate takes on a potentially more complex hue.\(^{40}\) As we apply the derivative work right to AI productions, we face obstacles stemming from controversial and uncontroversial aspects of the derivative work right. Let us begin with the latter.

B) (Relatively) Uncontroversial Aspects of the Derivative Work Right

There are a few aspects of the derivative work right that, in this Article’s submission, are mostly uncontroversial. The first is that a derivative work for which one claims protection under federal law must be a work. This implies that a derivative work must be original to itself be eligible for copyright protection.\(^{41}\) Second, unless one is prepared to violate the basic canon of statutory construction which guards against superfluity, the derivative work right cannot have the exact same scope as the right of reproduction.\(^{42}\) This logically implies that, although the Venn diagram of the two rights would show considerable overlap, some derivative works are not reproductions. Third, because the definition clearly refers to preexisting works, what is derived from must be one

---

\(^{38}\) Paul Goldstein, Goldstein on Copyright § 7.3 (3d ed. 2012); Paul Goldstein, Derivative Rights and Derivative Works in Copyright, 30 J. Copyright Soc’y U.S.A. 209, 221 (1983) (noting that “[i]t is no coincidence that the principal cases establishing broad rights against infringement by derivative works characteristically involve situations in which the alleged infringer had at some earlier point sought a license.”).

\(^{39}\) I am not the first scholar to point to the interpretive risks associated with the “based upon” clause. See, e.g., Naomi Abe Voegtli, Rethinking Derivative Rights, 63 Brook. L. Rev. 1213, 1263–67 (1997) (proposing a narrow formulation of the derivative right, in addition to broader fair use and a possible compulsory license).

\(^{40}\) See infra, Part III.A.

\(^{41}\) See Restatement of the Law, Copyright, supra note 9.

\(^{42}\) See George Costello, Cong. Rsch. Serv., Statutory Interpretation: General Principles and Recent Trends 12 (2006) (“[S]tatutes should be construed ‘so as to avoid rendering superfluous’ any statutory language.”).
or more “works,” i.e., works that are protected by copyright. Fourth, the notion of originality applied to the protection of derivative works requires that the person claiming to have authored a derivative work must have added or transformed one or more preexisting works in some way, shape, or form.

By combining the four above points, one can posit fairly safely that the derivative work right, properly applied and understood, is situated in a zone between (and occasionally “beyond”) reproduction, on the one hand, and uses that are inspired by, but not infringing (because they are not “based upon”), an earlier work, on the other hand. A final point that belongs in this section on less controversial aspects is that a derivative work is not protected if it is infringing, as the statute itself makes clear.

Beyond the points made in the previous paragraph, the analysis quickly enters more troubled waters.

C) The Originality Controversy

---

43 See 17 U.S.C. §§ 101, 106, supra note 4, and accompanying text. Arguably, this also includes works that were protected but whose term of protection expired, although in such a case the derivative work right would be irrelevant because it could no longer be enforced.

44 The Copyright Restatement draft refers to this as “original expression contributed by the author of the derivative work.” See RESTATEMENT OF THE LAW, COPYRIGHT, supra note 9, § 3(c).

45 This term is used in that very context in Lone Ranger Television, Inc. v. Program Radio Corp., 740 F.2d 718, 722 (9th Cir. 1984) (“[T]he protection of derivative rights extends beyond mere protection against unauthorized copying to include the right to ‘make other versions of, perform, or exhibit the work.’”) (emphasis added.) (quoting Russell v. Price, 612 F.2d 1123, 1128 n.16 (9th Cir. 1979)). Professor Ochoa has argued in a similar vein that the “reason the right to prepare derivative works was drafted without any reference to fixation was to make sure that public performances of derivative works would be covered.” See Tyler T. Ochoa, Copyright, Derivative Works and Fixation: Is Galoob a Mirage, or Does the Form(GEN) of the Alleged Derivative Work Matter?, 20 SANTA CLARA COMPUT. & HIGH TECH. L.J. 991, 1020 (2004).

46 This Article agrees with the characterization suggested in Timothy Everett Nielander, The Mighty Morphin Ninja Mallard: The Standard for Analysis of Derivative Work Infringement in the Digital Age, 4 TEX. WESLEYAN L. REV. 1, 2 (1997), as follows:

On the continuum between an exact reproduction of protected property, and the creation of an original work, lies a gray zone. This zone is a mixture of protected works—printed art, art on digital media, digital and analog music, and other works recognized as deserving intellectual property protection—that can be mixed and matched with other works to create new works. American law recognizes protection of this form of copying as derivative rights.

47 17 U.S.C. § 103(a) (“[P]rotection for a work employing preexisting material in which copyright subsists does not extend to any part of the work in which such material has been used unlawfully.”). See, e.g., Gracen v. Bradford Exch., 698 F.2d 300, 302 (7th Cir. 1983).
As the previous Section just explained, to be protected as a derivative work, a literary or artistic production must meet the originality condition applicable to other works of authorship. Does that mean that, to infringe the derivative work right (belonging to a third party), the derivative work must also be original? This is a controversial area of law. Recall that, to be protected as a work, a work must normally be both fixed and original.48

Professor Goldstein opined that the derivative work right may be infringed even if the derivative production would not qualify for protection as a work.49 The Ninth Circuit agrees, but as we move forward, one must ask whether this means that the derivative work may be infringed by a production that need not be original, need not be fixed, or both.

In two cases with similar fact patterns, a defendant took images from artwork prints or books and placed them on tiles which he then offered for sale.50 The defendants’ actions unquestionably did not involve copying (reproduction) of a protected work. These cases are interesting because precedents in which the derivative work right is infringed generally involve also a reproduction. In contrast, these cases clearly delineate an area for the derivative work right that the reproduction right does not cover.51 In Mirage Editions, referring to the statutory language that a derivative work must “recast, transform[] or adapt[]” one or more preexisting works in some form, the Ninth Circuit found that the tiles amounted to derivative works.52 In drawing a distinction between this type of mounting on tiles and traditional art reframing (which the court

48 See supra notes 9 and 10 and accompanying text.

49 Paul Goldstein, Derivative Rights and Derivative Works in Copyright, 30 J. COPYRIGHT SOC’Y U.S.A. 209, 231 n.75 (1983) (“[T]he Act does not require that the derivative work be protectable for its preparation to infringe.”).

51 Mirage Editions, 856 F. 2d at 1343 (“The protection of derivative rights extends beyond mere protection against unauthorized copying.”)

52 Mirage Editions, 856 F.2d at 1343–44.
acknowledged was a non-infringing activity), the court found that the use of a resin to glue the pictures on the tiles made a difference.\textsuperscript{53} In that case, fixation was obviously not an issue and originality was not discussed.

In another case, the Ninth Circuit found that it made “no difference that the derivation may not satisfy certain requirements for statutory copyright registration itself.”\textsuperscript{54} The works at issue were both voice recordings of scripts from the “adventures” of the Lone Ranger and the duplication, remixing, and distribution of those recordings “just as if he had hired the actors, sound effects crew, and producers originally used for the tapes to do a second interpretation of the scripts for an audience.”\textsuperscript{55}

In another case, the plaintiff argued that the derivative work right contained in § 106(2) was “intended to expand the definition of derivative works to include any work based on a copyrighted work.”\textsuperscript{56} Strangely perhaps, the court states that she had cited “no authority to support this novel proposition.”\textsuperscript{57} There was, however, one authority in plain view: the text of the statute adopted in 1976.\textsuperscript{58} This seems to suggest that the “based upon” clause is not likely to create a huge new zone of exclusivity for copyright owners compared to the previous (1909) Act.\textsuperscript{59}

Then in \textit{Galoob v. Nintendo}, a case involving a technology that allowed players of Nintendo video games to alter features of a game (e.g., by increasing the number of lives of the player’s character), the Ninth Circuit held that the derivative work right could be infringed even without the production by the defendant of a “fixed” derivative work, thus eliminating at fixation

\end{footnotesize}
requirement from the infringement equation. To reach this conclusion, the court found that the statute, which equates “creation” with “fixation,” was not to be read as containing an indirect definition of the notion of “work,” only as providing a definition of the moment of creation/fixation of a work. The court also noted that the statutory definition of “derivative work” did not explicitly require fixation. Interestingly, the court considered a Seventh Circuit case concerning a chip used to speed up video games in which the court found that the defendant’s chip contained a derivative work. The Ninth Circuit drew a distinction because the technology in the Seventh Circuit case copied the computer chip whereas the technology at play in Galoob did not. Yet, as the Seventh Circuit itself acknowledged, the Ninth Circuit noted that it was a “stretch” to find the chip contained a derivative work, a stretch that the Ninth Circuit considered a bridge too far. As this Article sees it, the Ninth Circuit cases focus largely on the protection of the market for the original work and potential derivatives made or authorized by the copyright owner. Indeed, it agrees with Professor Goldstein’s view that a derivative work “effectively creates a new work for a different market.”

There are potentially dissonant notes in Ninth Circuit jurisprudence, however. For example, in two cases, that Circuit agreed with the proposition that a “work will be considered a derivative work only if it would be considered an infringing work if the material which it has derived from a prior work had been taken without the consent of a copyright proprietor of such

65 Id. (citing Midway Mfg., 704 F.2d at 1014).
prior work.” This would seem to imply that the derivative work must meet all the requirements for protection as a work. The Nimmer treatise and several appellate circuits prefer that approach. According to Nimmer, a “work will be considered a derivative work only if it would be considered an infringing work if the material which it has derived from a preexisting work had been taken without the consent of a copyright proprietor of such preexisting work.”

Other circuits have taken what looks like a different approach. In a case involving a fact pattern fairly similar to Muñoz and Mirage, the Seventh Circuit considered the Ninth Circuit precedents, but found that the tiles self-evidently neither “recast” nor “adapted” the preexisting works. The court then took a deeper look at the “transformed” prong but concluded that the preexisting works were not transformed in the slightest, a view with which many copyright scholars agree. As the Court noted, the “art was bonded to a slab of ceramic, but it was not changed in the process. It still depicts exactly what it depicted when it left Lee’s studio.” In deciding that the works lacked the required originality, the Seventh Circuit ostensibly relied in part on a case predating the entry into force of the 1976 Copyright Act in which the Second Circuit en banc had found that plastic reproductions of a public domain cast iron “banks” were not original. The Second Circuit had decided in that case to follow “the school of cases in this circuit and elsewhere supporting the proposition that to support a copyright there must be at least some

substantial variation, not merely a trivial variation such as might occur in the translation to a different medium.”74

The Seventh Circuit went a step further than Lee v A.R.T. in Gracen.75 It held that paintings of the character Dorothy in The Wizard of Oz (based on stills from the movie) were not original enough to be protected by copyright.76 The painting even changed the background using a different scene from the movie. All to no avail.77 Yet the court also noted that a more or less exact replica of a scene captured from nature would be original enough.78 Gracen would seem to support the idea of a heightened originality standard for derivative works, which most courts have rejected.79 Finally, the Eleventh Circuit also discussed Mirage, which it described as “much-criticized,” and found the epoxy glue argument (as compared to traditional framing) “highly questionable.”80

This tour d’horizon allows us to answer the two above-mentioned questions. First, if a derivative work is legally produced, then must it meet the originality and fixation requirements to be protected as a work? The answer is yes, and the applicable standard is the same as for other types of works.81 The legal nature of the derivative work can stem from an authorization from the copyright owner (directly, as a valid sub-license etc.), from an exception such as fair use, or

75 Gracen v. Bradford Exch., 698 F.2d 300 (7th Cir. 1983).
76 See id.
77 “We do not consider a picture created by superimposing one copyrighted photographic image on another to be ‘original’—always bearing in mind that the purpose of the term in copyright law is not to guide aesthetic judgments but to assure a sufficiently gross difference between the underlying and the derivative work to avoid entangling subsequent artists depicting the underlying work in copyright problems.” Id, at 305.
78 See id.
79 See RESTATEMENT, supra note 9, at §3, comment e (“From time to time, some courts have suggested that there is a special, heightened originality standard for derivative works. But most have rejected that view.[…] The better view, and the one adopted by this Restatement, is one that applies a consistent originality standard to derivative and non-derivative works.”).
81 Id.
because the underlying work is no longer protected. Second, *to infringe* the right to prepare derivative works in 17 U.S.C. §106(2), must the alleged derivative work meet the originality standard, even if the work need not be fixed? Here, we may face a circuit split, with the Seventh and Eleventh Circuits on one side, and the Ninth Circuit on the other—though not all of its precedents are necessarily neatly lined up in single file. As we move forward, either we accept that to infringe the derivative work right the defendant must have contributed some originality, or the Ninth Circuit correctly stated the law in not looking for originality in the defendant’s production alleged to infringe the derivative work right, even though its application of that law to the facts of *Mirage* and *Muñoz* may well have been incorrect. To summarize where we are,

(a) Something must be added or done to a pre-existing work to make a derivative work;

(b) To be protected as a derivative work, a production must be original and fixed, and at least partially non-infringing;

(c) it seems well-established that a production can infringe the derivative work right even if it is unfixed; and

---

82 “Notwithstanding the provisions of sections 106 and 106A, the fair use of a copyrighted work […] is not an infringement of copyright,” 17 U.S.C. § 107. This means that fair use covers copyright rights contained in those two sections, including the right to prepare derivative works.

83 A question embedded in the first alternative is whether the originality added to pre-existing works must be such that it is self-standing, a matter on which there is some degree of disagreement among scholars. See William F. Patry, *Patry on Copyright*, §12:14.50 (2019) (“There is no necessary correlation between originality and infringement. The statute is to contrary.”) But see 2 Paul Goldstein, *Copyright* § 7.3 (3d ed. 2005) (suggesting that a derivative work must contain material that is “capable of standing on its own as a copyrightable work.”) The latter statement is certainly correct as to whether a protectable derivative work was produced.

84 Courts have used several tests to decide whether “enough” was added to make a production a derivative work, but generally in the context of deciding whether it was protectable, not whether it was infringing. For a discussion, see *Nimmer* §3.54 (2020). There is no disagreement that this Author can see about the need for a protectable derivative work to be original. The question is whether originality (but not fixation) is required to infringe.

85 The text of the statute suggests rather clearly that it is only parts of a derivative work that contain infringing material that are unprotected. 17 U.S.C. §103(a) (“[P]rotection for a work employing preexisting material in which copyright subsists does not extend to any part of the work in which such material has been used unlawfully.”)
(d) is the derivative work infringed if an production, whether fixed or unfixed, recasts, adapts or transforms one or more pre-existing works even if said production is not original?

Before moving to a suggested answer, however, a brief look at the difference between derivation and reproduction is in order.

D) The Relationship between Reproduction and Derivation

As already noted, the preparation of a derivative work (what one could label derivation) and reproduction are two of the exclusive rights of a copyright owner. There is little doubt that the two rights, if seen as separate sets on a Venn diagram, would overlap considerably. Take the adaptation of a novel to the stage. Much of the novel’s expression would likely be copied in the play, in particular, of course, the dialogues. Which exclusive right would be infringed? In a nutshell, the infringement standard for the right of reproduction is one of substantial similarity between protectable elements of the plaintiff’s work and the defendant’s, which essentially means protected expression. In such a case, a reproduction right analysis may be justified yet this is principally, as the Article sees it, a matter for the derivative work right.

87 Sheldon v. Metro-Goldwyn Pictures Corp., 81 F.2d 49, 55–56 (2d Cir. 1936.) (noting that one can also infringe by taking elements from a novel without any of the dialogues when making an adaptation as a motion picture because “some of it is plainly drawn from the novel; but that is entirely immaterial; it is enough that substantial parts were lifted.”).
88 See e.g., Concrete Machinery Co., Inc. v. Classic Lawn Ornaments, Inc., 843 F.2d 600, 606, 6 U.S.P.Q.2d (BNA) 1357 (1st Cir. 1988) (“Copying therefore is generally established by showing that the defendant had access to the copyrighted work and that the offending and copyrighted articles are “substantially similar’”). On the limitation that this test is applied to protectable elements, see Compulife Software Inc. v. Newman, 959 F.3d 1288, 1306 (11th Cir. 2020) (“If the defendant carries this burden as to any portion of the copied material, that material should be filtered out of the analysis before comparing the two works.”). Expression is used here to distinguish ideas, which are not protected (under 17 U.S.C. § 102(b)), and “protected expression” is used to indicate that some expression is not protected; Bucklew v. Hawkins, Ash, Baptie & Co., LLP., 329 F.3d 923, 929 (7th Cir. 2003) (for example if in the case of a merger between idea and expression (in which case the 102(b) exclusion applies) or the expression constitutes a scène à faire, that is elements that are “so rudimentary, commonplace, standard, or unavoidable that they do not serve to distinguish one work within a class of works from another.”).
That right can apply even if or when the right of reproduction reaches its limits. This is not surprising as the domain of both rights must be different to avoid superfluity of the statutory text.

A full discussion of the relationship between 17 U.S.C. §§ 106(1) and (2) is beyond the scope of this Article. In previously published work, I argued that, though the outcome of the analysis (that is, determining whether the defendant’s work is prima facie infringing or non-infringing) is often the same, the analytical path is different. In the right of reproduction context, the infringement stems, as just noted, from the copying of protected expression. In the case of derivation, the test is whether creative choices that gave the plaintiff’s work its originality were copied. The latter analysis could be said to operate at a higher level of abstraction, as it searches for the actual cause of the originality instead of the original expressive elements in themselves.

Adding a teleological layer to the analysis, recall, in addition, that the purpose of derivation is to adapt or recast the pre-existing works for a different context, such as those listed as illustrations in the statute.

E) Application to AI

The application of the previous Section’s findings to the first question above to the AI context means that to be protected under federal law, the production of an AI machine must have originality. As the Author has argued elsewhere, this requires human authorship. Courts would

---

89 See generally Gervais, Foxes, supra note 34.
90 See supra note 86.
91 See Gervais, Foxes, supra note 34 at 839–47.
92 See id.
93 17 U.S.C. §101 (“translation, musical arrangement, dramatization, fictionalization, motion picture version, sound recording, art reproduction, abridgment, condensation,” although Congress clearly intended this list to be non-exhaustive when it added “or any other form in which a work may be recast, transformed, or adapted.”).
94 See generally Gervais, The Machine as Author, supra note 1. See also supra note 13.
make what the Author considers a grave mistake if they protected literary and artistic productions without (human) originality.\textsuperscript{95}

The answer to the second question is the one that the Article will now answer more fully. It can be framed as follows: if one considers that, to infringe the derivative work right, a production must itself be a work and, therefore, original (but not protected, even if original, if it is infringing or unfixed, as noted above), then \textit{machines that by their nature cannot produce originality} (due to a lack of human cause) \textit{cannot infringe this right}.

The solution to this quandary rests in part on a crucial doctrinal point. If the above proposition true, it would mean that a machine translation, adaptation or other derivation from one or more preexisting works would be scot-free under 17 U.S.C. §106(2) if it did not result demonstrably and sufficiently from human creative choices, because a non-original production cannot be a work, and, therefore, it cannot be a derivative work.\textsuperscript{96} Naturally, the machine production could still be—and in many cases, as we will see shortly, would likely be considered—a reproduction one must recall that 17 U.S.C. §§106(1) and 106(2) must have different real estate to cover.\textsuperscript{97} The key takeaway to use going forward in the analysis is that, under the Ninth Circuit test, a machine could infringe 17 U.S.C. §106(2) but not under the Seventh (or Eleventh’s) Circuit’s.

Let us imagine seven different scenarios. For the purpose of this analysis, let us assume that the works used are (still) protected by copyright, that is, the expiration of the term of protection will be set aside for illustrative purposes.\textsuperscript{98} \textit{Scenario 1. AI machine produces a painting “based

\textsuperscript{95} See id at 2102–03.
\textsuperscript{96} The Machine as Author, supra note 1, at 2100–01.
\textsuperscript{97} See supra Part III.C and D).
\textsuperscript{98} 17 U.S.C. §§ 302(a), 305 (establishing that for a typical work of art under current U.S. rules, the copyright lasts for the life of the author plus seventy years, extended until December 31\textsuperscript{st} of the seventieth year after the author’s death.).
upon” a dataset comprising 100 Impressionist and post-Impressionist paintings showing landscapes from the South of France. The corpus includes works by Bonnard, Cezanne, Matisse, Morisot, Renoir, Signac, and others. The machine’s output gives (if the reader will pardon the pun) the same impression as a “traditional” Impressionist painting but it does not include any distinguishable element from any of the paintings in the dataset.99

In this first scenario, as the Article sees it, the computer does not in fact derive; instead, it finds correlations and patterns to use as a matrix for its own production. As there is no substantial similarity between the painting used in the machine-learning context, the issue of substantial similarity does not apply. When it comes to derivation, the aggregation of choices into a “blend” where pre-existing works are no longer individually identifiable means that we are not in the presence of an infringing derivative work—even assuming that what the machine has produced is a “work.” True, the correlations probably reflects in some distant way the creative choices that authors of pre-existing works incorporated into their expression, but that does not recast, transform or adapt identifiable pre-existing works.

Scenario 2. AI machine produces a painting of the famous Japanese bridge in Monet’s garden at Giverny “based upon” a dataset comprising thirty paintings of the bridge by various artists. The machine’s output resembles existing paintings, including some by Monet, but none is a replica.

While the analysis in this second case is fairly similar to the previous scenario, it is possible that the output, though not a replica, will bear some substantial similarity to one or more of the works used in the machine-learning context, which should trigger a reproduction right analysis,

99 OXFORD ILLUSTR. ENCYCL. OF THE ARTS 218 (J.J. Norwich Ed.) (Oxford Univ. Press, 1990) (explaining that the term “Impressionist” was actually used derisively to refer to the impression that works that tried “to capture the effects of light on various surfaces, particularly in open-air settings” tried to create).
work-by-work. It is much less likely that the machine’s output would infringe the right to prepare derivative works for three reasons. First, if there are identifiable, substantially similar elements from individual works in the data corpus in the machine’s output, then, as just noted, this should be considered under 17 U.S.C. §106(1). Second, it strikes the Author as functionally impossible to isolate creative choices of one author of one pre-existing work in a way that would not be in fact a copy of the actual expression. Third, teleologically, there is no adaptation or recasting here of the type that the statute suggests is the purpose of 17 U.S.C. §106(2). It is a painting similar to those in the dataset.

*Scenario 3. AI machine produces a painting of the same bridge in the same garden as in the previous scenario, but “based upon” five paintings all by Claude Monet.*

In this third scenario, there is a higher risk that the reproduction right would be engaged because there is a smaller, finite number (five) of well identified works. The derivative work right could also be relevant under a broad understanding of “based upon” since all the creative choices are by the same author. One could argue that, if creative choices were “transferred” from the five paintings to the machine-produced painting, then that could trigger the application of right. However, for the same reasons as in the previous scenario, the Article suggests that the analysis should be carried out under §106(1). It is not the purpose of §106(2) to be the glazing on the §106(1) donut, as it were. Each right has its own target and purpose.

*Scenario 4. AI machine produces a painting “based upon” a dataset of five abstract paintings that contain geometric shapes such as circles, squares, and triangles.*

The main difference between the third and fourth scenarios in terms of the infringement analysis is that common symbols are not protected expression.100

---

100 Copyright protects original expression, not common symbols, letters. See RESTATEMENT OF THE LAW, COPYRIGHT, *supra* note 9, at §§5 (c).
Scenario 5. AI machine, using a 3D printer, creates sculptures using any image or set of no more than five images as its basis. The user of the AI machine has obtained a license to reproduce the images. When using more than one image, the machine selects parts of each. The shape of the sculpture is based on a large database of modern sculptures and images and is designed to fit what the machine “recognizes” in the image or images it is asked to “turn into” a sculpture.

This fifth scenario stands directly in the analytical path of the Article. The images that were reproduced would normally trigger a §106(1) analysis, but the reproduction is licensed. Then, as images were transformed into a sculpture, a stronger case of derivation can be made than in previous scenarios. This is not quite as straightforward as in the so-called tile cases, where images were simply cut and pasted.\[10]

Moreover, the market for sculptures is possibly quite different than the market for the images themselves. A real recasting of the image(s) takes place. Absent fair use or some other defense, the application of §106(2) may thus be warranted.

Scenario 6. AI machine produces music “based upon” the dataset in scenarios 1, 2, and 3 and a vast database of musical recordings containing classical, jazz, and rock pieces and information about human emotional reactions to colors and shapes, harmonies, and melodies. In creating the music, the machine tries to correlate images and sounds that produce similar emotional reactions.

In this sixth and last scenario, there is no reproduction of any of the paintings. Is there a derivation? Again, a broad reading of the statute could lead to this conclusion and music does appear to be a different market and a type of transformation that could lead one to argue for the application of §106(2). Yet, what is “taken” from the painting does not appear in the output. The

\[10\] See supra Part III.C for a description of the tile cases.
paintings become pure data, as it were. The distance between the paintings and the musical output is such that neither §106(1) or §106(2) is triggered.

Scenario 7. AI machine produces a translation into English of all the novels that won the top literary prizes in fiction in French, Italian, Japanese and Spanish. No licensing arrangement is in place.  

This scenario demonstrates the problem with the “only original derivative works can infringe” approach combined with a human authorship requirement (and recall that abandoning that requirement could give catastrophic effects). The machine would be able to produce these free translations without a license unless one were also able to make a case under the reproduction right, which takes us back to the circularity problem: if every violation of 17 U.S.C. §106(2) is also a violation of 17 U.S.C. §106(1), then Congress wasted legislative ink.

Does it make sense to achieve an outcome where machine productions can produce scot-free (under 17 U.S.C. §106(2) at least) but not humans? Asked that way, the answer emerges. Machines should not be placed in a better position than humans. Then a teleological layer can be added to the analysis. If the purpose of the statute is to allow new creations to be inspired by existing ones, “hopefully, ad infinitum,” in a cycle that “makes copyright ‘the engine of free expression,’” then whose expression are we talking about?

---

102 This isn’t that far-fetched. For examples of sites that offer this service as of early 2022, see Dragneel, Top 5 Machine Translation Sites for Novels, DragneelClub (Jan. 1, 2022), available at https://dragneelclub.com/top-5-machine-translation-sites-for-novels/

103 See supra notes 12 and Error! Bookmark not defined.. In this case, this would likely take the floor from under the market for human translators, and that expertise would be lost.

104 If one wants to claim that machines should have equal rights, then one can endeavor to prove that point. This Article most certainly will not.

The Supreme Court also wrote that “[b]y establishing a marketable right to the use of one’s expression, copyright supplies the economic incentive to create and disseminate ideas.”\(^{106}\) This followed in the wake of another pronouncement by the Court, three decades earlier, that “[t]he economic philosophy behind the clause empowering Congress to grant patents and copyrights is the conviction that encouragement of individual effort by personal gain is the best way to advance public welfare through the talents of authors and inventors in ‘Science and useful Arts.’”\(^{107}\)

As I read these encapsulations of copyright law’s policy underpinnings, the reward to an author is for what that author has created, and what is then “derived” (as the term is defined in copyright law) from her work. As explained above, the key distinction between reproduction and derivation is that the former copies the expression of a protected work, while the latter means reusing the creative choices that make a work original.\(^{108}\) Applied to the AI context, the fact that the human programmer of the AI machine can get copyright protection for the code she produced is not controversial, but then to stretch the beam of protection to outputs produced by the machine using that code is at least one step removed—a crucial step it is. The test will be whether the creative choices made by the program’s author (or arguably by the user, if applicable) are present in the machine’s output.\(^{109}\) If not, protecting that output as the work of the programmer (or user)
AI DERIVATIVES

is incompatible with both fundamental doctrinal tenets of copyright and its policy purpose, and it
over-rewards the programmer (or user).\textsuperscript{110}

The Article thus concludes that productions need to be original to infringe 17 U.S.C §
106(2).\textsuperscript{111} Under an originality test, the question would be whether a production, if fixed and to
the extent that it is non-infringing, would be protectable. In this Article’s view, that is the incorrect
inquiry. Originality, as defined in \textit{Feist}, is a protection threshold, not an infringement standard.\textsuperscript{112}

IV. DIFFERENT DEBATES ABOUT OTHER AI-RELATED RIGHTS AND EXCEPTIONS

In this short Part, the Article explores two related areas of law to ensure that the arguments
contained up to this point are neither misunderstood nor applied out of context. Those two areas
are the calls for a new, sui generis right in AI productions, and the relationship between the
protection of AI outputs and the need for text and data mining exceptions.

A) \textit{Sui generis rights}

If courts follow the doctrinal and/or normative views expounded in this Article and
espoused in whole or in part by several other scholars, then there would be no copyright protection
for AI productions that do not have a human cause.\textsuperscript{113} As the previous Section explicated, AI
machines that process datasets consisting of protected works will, however, be able to produce
outputs that infringe both the reproduction and, in some cases, the derivative work right. The first
of those conclusions will quickly find in its way a normal reflex in our market-based economy to

\textsuperscript{110} See Samuelson, supra note 12, at 1208 (It would “over-reward[] the programmer, particularly in light of the fact
that the programmer is no more able to anticipate the output than anyone else.”). Anticipation is of course directly
related to causality.

\textsuperscript{111} In saying that, however, the Article would still take the view that, as applied to their facts (tiles on which images
were glued), \textit{Mirage} and \textit{Munoz} were wrongly decided. \textit{See supra} notes 52 and 53.

\textsuperscript{112} \textit{See supra} note 10 and accompanying text.

\textsuperscript{113} \textit{See Gervais, Human Cause, supra} note 13.
appropriate any value that can be traded.\textsuperscript{114} Hence, if copyright is not available, calls for a new, so-called sui generis right will thus likely emerge. Indeed, they already have.\textsuperscript{115}

Sui generis protection of databases, as it exists in the European Union (EU), is predicated not on progress of science and useful arts or human progress more generally but rather on investment protection.\textsuperscript{116} The temptation to create such a right is simple, yet ill-founded. The argument goes as follows: there is investment in AI and any investment should benefit from some form of legal protection. This claim is either false or at least a major overstatement.\textsuperscript{117} Then, the temptation is also based on the fact that sui generis rights do not require originality, which obviates the doctrinal difficulty explained in the previous Part.\textsuperscript{118}

There are several solid arguments that cast serious doubt on the usefulness of a sui generis right in AI machine productions. First, this Author has been unable to find convincing evidence of underinvestment in AI research and development.\textsuperscript{119} Second, AI machines may in short order

\begin{itemize}
  \item \textsuperscript{114} See Gregory Alan Bonadies, Property Rights and International Trade: An Institutional Determinant of Export Structure, at 14 (Dec. 2016) (Ph.D. dissertation, The University of Southern Mississippi) https://aquila.usm.edu/cgi/viewcontent.cgi?article=1904&context=dissertations (“Governments exist to develop and implement systems of property right laws to control the use and exchange of property for public and private purposes including production.”).
  \item \textsuperscript{115} See Ana Ramalho, Will Robots Rule the (Artistic) World?: A Proposed Model for the Legal Status of Creations by Artificial Intelligence Systems, 21 J. INTERNET L. 1, 20 (2017) (“It also is possible to consider the grant of a sui generis right in AI-created works, much as the EU legislature decided to do for makers of databases. The common rationale here is protection of investment.”); Ricketson, supra note 1, at 36–37 (suggesting that humans who own or use machines might “obtain strong and effective protection under a neighboring rights or sui generis regime”).
  \item \textsuperscript{116} See Ramalho, supra note 115; Katleen Janssen, Jos Dumortier, The Protection of Maps and Spatial Databases in Europe and the United States by Copyright and the Sui Generis Right, 24 JOHN MARSHALL J. COMPUT. & INFO. L. 195, 214 (2006) (noting that the EU’s sui generis database right “protects the investment in a database, and not creativity”).
  \item \textsuperscript{117} There is some form of protection, for example against expropriation or, in the case of foreign investment by multinationals, under investor-state-dispute-settlement (ISDS), but there is no rule that any and all investment must be protected by law. See Daniel Gervais, Investor-State Dispute Settlement: Human Rights and Regulatory Lessons from Lilly v. Canada, 8 UC IRVINE L. REV. 459, 466 (2018) (“ISDS provides multinational corporations a right to sue states that are parties to an investment treaty (such as a bilateral investment treaty or BIT) or a trade agreement containing an investment protection chapter for direct or indirect expropriation.”)
  \item \textsuperscript{119} Quite the opposite. For example, the International Data Corporation forecasts accelerating growth over the next few years. See IDC, IDC Forecasts Improved Growth for Global AI Market in 2021 (Feb 23, 2021), https://www.idc.com/getdoc.jsp?containerId=prUS47482321.
\end{itemize}
be able to produce massive amounts of literary and artistic output, which will quickly risk crowding out the field if each production was protected by exclusive copyright rights, or even a sui generis right against some form of reuse.\textsuperscript{120} Third, while the United States does not have sui generis database protection (despite several failed attempts in Congress to enact it), it does not seem to have provided the EU with a noticeable comparative advantage in database investment.\textsuperscript{121} If anything, the database directive is viewed as a policy failure.\textsuperscript{122}

Against this backdrop, it seems reasonable to suggest that proponents of a new sui generis right in literary and artistic productions of AI machines bear the burden of proof. They should not be allowed to rely simply on hollow-ringing policy clichés. At the very least, one should be able to identify a market failure, and that failure cannot be the insufficiency of the rate of replacement of human authors in the marketplace, as this is the exact opposite of what policy endeavors should aim for.\textsuperscript{123} Lastly, if and when the proponents of a sui generis right are able to discharge their burden of proof, there will remain “immense challenges” in defining the exact contours of the right.\textsuperscript{124}

B) Text and Data Mining

\textsuperscript{121} On attempts to introduce EU-style law in the United States, see Janssen and Dumortier, supra note 116, at 223 (“Since the introduction of the European database directive in 1996, a number of bills have been introduced in the U.S. Congress, some of which were based on the database directive . . . .”). See also Samuel E. Trosow, Sui Generis Database Legislation: A Critical Analysis, 7 YALE J.L. & TECH. 534, 627 (2004–2005); Daniel Gervais, The Protection of Databases, 82 CHI.-KENT L. REV. 1109–1169 (2007).

\textsuperscript{123} For a more complete explanation on this point, see Gervais, The Machine as Author, supra notes 1 .

\textsuperscript{124} Peter K. Yu, Data Producer’s Right and the Protection of Machine-Generated Data, 93 TUL. L. REV. 859, 929 (2019).
Up to this point, the Article has essentially focused on the output of AI machines. Text and data mining (TDM) is the flip side of the process, namely the input. It refers to “computational processes for applying structure to unstructured electronic texts and employing statistical methods to discover new information and reveal patterns in the processed data.”

The terms “text” and “data” are “broad enough to include fixed images, sound recordings, and audio-visual works.” The ultimate example of TDM might be scanning by Google of entire libraries of books, a process that the Second Circuit determined was a fair use. The EU, whose legislative experiment about databases was discussed in the previous Section, has experimented in this area as well, with the adoption in 2019 of a Directive on Copyright in the Digital Single Market that provides two separate provisions on TDM. The first exception allows TDM “for the purposes of scientific research” by “research organisations and cultural heritage institutions.” The second exception is not limited to any particular category of user but rightsholders are able to opt out. The Directive also explains that “there is widespread acknowledgment that text and data mining can, in particular, benefit the research community and, in so doing, support innovation.”

---

127 Authors Guild, Inc. v. HathiTrust, 755 F.3d 87, 97 (2d Cir. 2014); Authors Guild v. Google, Inc., 804 F.3d 202, 207 (2d Cir. 2015). There is little doubt in the Author’s mind that the main value of this corpus is not in making snippets available (though that is what gave the use its fair nature), but the possibilities afforded by the mining of the data. At this point, only Google and those it partners with can reap that benefit.

129 *Id.*, art. 3(1).

130 *Id.*, art. 4(3).

131 *Id*., recital 8.

In the United States, the solution is more likely to come from courts interpreting the fair use doctrine than from Congress.\footnote{See \textit{Sag}, supra note 126, at 366 (explaining that US courts do not see TDM as interfering with the protection of copyrighted works).} Be that as it may, the debate about allowing TDM inputs, which can have a positive valence in many areas, for example, in assisting scientific research, should be dissociated from the separate matter of the protection that applies, or could apply, to the outputs of AI machines.

\section*{V. Conclusion}

Lawmaking by courts and legislators in the coming years will include the unprecedented challenge of adapting “our” legal system to a new, artificially intelligent “species” that can mimic and indeed surpass humans at many tasks involving the one feature that had distinguished humans from other species, and indeed allowed the dominion of humans over those species.\footnote{See generally Daniel Gervais, \textit{Towards an Effective Transnational Regulation of AI}, 2021 AI & SOC’Y.} One of the specific challenges will be the adaptation of copyright law to literary and artistic productions of AI machines. This Article makes a contribution to the exploration of this challenge by explicating how the derivative work right, sometimes seen as copyright’s poor cousin in a house occupied mostly by the rights of production and public performance, may be called upon to step forward in litigation to either protect machine productions or find them infringing, in part because the very process of AI-based machine learning, which leads to those productions, is arguably a form of derivation. The Article explains why the scope of the derivative work right should be cabined in
that context. The Article also considered the caselaw concerning the requirement that a derivative work be original and suggests how it should be applied in the AI context. Finally, the Article also briefly discussed proposals to create a non-copyright, sui generis right in machine outputs, and clarified the linkage between the debates about copyright in such outputs and exceptions designed to allow text and data mining.
